

## Worldwide use of ESG-NetCOP

International success for ESG's tool for planning and optimisation of telecommunication networks

### Munich, 6 December 2006

Mobile operators in 11 countries plan their networks with a tool from ESG. With its solution NetCOP the company contributes to the connectivity and security of the mobile communication of 140 million subscribers. The number stands for itself: ESG-NetCOP is the established tool for mobile network planning. In Europe some of the largest and most important mobile operators are NetCOP customers, such as the Orange or the Vodafone groups.

Modern telecommunication networks require – due to the explosively growing communication volume and the extreme innovation rate – comprehensive and flexible planning methods and tools. ESG-NetCOP allows mobile operators to test different scenarios and provide new services rapidly – thus shortening planning cycles significantly. The integration of planning algorithms supports the systematic realisation of potential in the planning phase, the “real-time” comparison of alternatives and the identification of the optimal solution with regards to cost and quality. The international success of the tool suite is also based on its modularity. The individual modules provide an integrated basis for the planning of access, core and transport networks of 2G, 2.5G and 3G networks. The nine NetCOP modules allow an individual customisation to user requirements. To reduce time to market for new services in mobile communications, NetCOP is the systematic way forward. Its international success proves this impressively.

Visit ESG at Arabcom 2007 in Dubai from 11th to 12th April 2007.
